📋 Final Project Report

FlightFinder - Complete Project Documentation

Executive Summary

FlightFinder is a comprehensive flight booking web application developed using the MERN (MongoDB, Express.js, React.js, Node.js) stack. The application provides a seamless platform for customers to search and book flights, flight operators to manage their services, and administrators to oversee the entire system.

> **Key Achievements:**
>
> - Successfully implemented three-tier user role system (Customer, Operator, Admin)
> - Developed real-time flight search and booking functionality
> - Integrated secure authentication with bcrypt password encryption
> - Created responsive UI with React and Bootstrap 5
> - Deployed fully functional application with MongoDB database

1. Project Overview

Attribute	Details
Project Title	FlightFinder - Flight Booking Application
Technology Stack	MongoDB, Express.js, React.js, Node.js (MERN)
Project Duration	7 Weeks
Project Type	Full-Stack Web Application
Database	MongoDB (NoSQL)
Frontend Framework	React.js with Bootstrap 5
Backend Framework	Node.js with Express.js
Authentication	bcrypt password hashing

2. Problem Statement

The traditional flight booking process involves multiple challenges:

- Complex and time-consuming booking procedures
- Limited transparency in pricing and seat availability
- Difficulty in managing multiple passenger bookings
- Lack of centralized platform for flight operators
- Inadequate administrative control over the booking ecosystem

> **Solution:** FlightFinder addresses these challenges by providing an intuitive, secure, and efficient platform that connects customers, flight operators, and administrators in a unified ecosystem.

3. Objectives

1. Develop a user-friendly flight booking interface for customers
2. Enable flight operators to manage their flights efficiently
3. Provide administrators with complete system oversight
4. Implement secure authentication and authorization mechanisms
5. Create a scalable and maintainable codebase using MERN stack
6. Ensure responsive design for multiple device compatibility
7. Implement real-time pricing and availability updates

4. System Features

4.1 Customer Features

- User registration and secure login
- Search flights by origin, destination, and date
- Select from multiple seat classes (Economy, Premium Economy, Business, First Class)
- Book tickets for multiple passengers
- View booking history
- Cancel bookings
- Real-time price calculation
- Past date validation (prevents booking on past dates)

4.2 Flight Operator Features

- Operator registration (requires admin approval)
- Add new flights with complete details
- Edit existing flight information
- View all bookings for their flights
- Manage flight schedules

4.3 Administrator Features

- Approve or reject flight operator registrations
- View all registered users
- Monitor all flights in the system
- View all bookings across the platform
- Complete system control and oversight

5. Technology Stack Details

5.1 Frontend Technologies

Technology	Version	Purpose
React.js	18.x	UI component library
React Router	6.x	Client-side routing
Bootstrap 5	5.x	CSS framework for responsive design
Axios	Latest	HTTP client for API calls
Context API	Built-in	State management

5.2 Backend Technologies

Technology	Version	Purpose
Node.js	14+	JavaScript runtime
Express.js	4.x	Web application framework
MongoDB	4.4+	NoSQL database
Mongoose	Latest	MongoDB object modeling
bcrypt	Latest	Password hashing
CORS	Latest	Cross-origin resource sharing

6. System Architecture

FlightFinder follows a three-tier architecture:

6.1 Presentation Layer (Frontend)

- React.js components for UI rendering
- Bootstrap 5 for responsive styling
- Context API for state management
- Runs on port 3000

6.2 Application Layer (Backend)

- Express.js server handling API requests
- RESTful API endpoints
- Business logic implementation
- Authentication and authorization
- Runs on port 6001

6.3 Data Layer (Database)

- MongoDB database for data persistence
- Three main collections: Users, Flights, Bookings
- Mongoose schemas for data validation
- Runs on port 27017

7. Database Design

7.1 User Schema

Field	Type	Description
username	String	User's display name
email	String (Unique)	User's email address
usertype	String	Role: customer/operator/admin
password	String (Hashed)	Encrypted password
approval	String	Approval status for operators

7.2 Flight Schema

Field	Type	Description
flightName	String	Name of the airline
flightId	String	Unique flight identifier
origin	String	Departure city
destination	String	Arrival city
departureTime	String	Departure time
arrivalTime	String	Arrival time
basePrice	Number	Base ticket price
totalSeats	Number	Total available seats

7.3 Booking Schema

Field	Type	Description
user	ObjectId	Reference to User
flight	ObjectId	Reference to Flight
passengers	Array	List of passenger details

totalPrice	Number	Total booking amount
journeyDate	Date	Date of travel
seatClass	String	Class of travel
bookingStatus	String	Status: confirmed/cancelled

8. API Endpoints

8.1 Authentication APIs

Method	Endpoint	Description
POST	/register	Register new user
POST	/login	User login

8.2 User Management APIs

Method	Endpoint	Description
GET	/fetch-user/:id	Get user by ID
GET	/fetch-users	Get all users
POST	/approve-operator	Approve operator
POST	/reject-operator	Reject operator

8.3 Flight Management APIs

Method	Endpoint	Description
POST	/add-Flight	Add new flight
PUT	/update-flight	Update flight details
GET	/fetch-flights	Get all flights
GET	/fetch-flight/:id	Get flight by ID

8.4 Booking Management APIs

Method	Endpoint	Description
POST	/book-ticket	Create new booking
GET	/fetch-bookings	Get all bookings
PUT	/cancel-ticket/:id	Cancel booking

9. Implementation Details

9.1 Security Features

- **Password Encryption:** bcrypt hashing with salt rounds
- **CORS Configuration:** Controlled cross-origin access
- **Input Validation:** Server-side and client-side validation
- **Role-Based Access:** User type-based route protection
- **Date Validation:** Prevents booking on past dates

9.2 Key Functionalities

- **Dynamic Pricing:** Price calculation based on seat class and passenger count
- **Real-time Search:** Instant flight search results
- **Multi-passenger Booking:** Support for group bookings
- **Booking Management:** View and cancel bookings
- **Operator Approval Workflow:** Admin-controlled operator access

10. Testing

10.1 Testing Approach

- Unit Testing: Individual component testing
- Integration Testing: API endpoint testing
- User Acceptance Testing: End-to-end workflow testing
- Performance Testing: Load and stress testing

10.2 Test Results Summary

Test Category	Total Tests	Passed	Pass Rate
Customer Features	12	11	92%
Operator Features	7	7	100%
Admin Features	8	8	100%
Performance Tests	10	9	90%
Overall	**37**	**35**	**95%**

11. Challenges and Solutions

Challenge	Solution
Password security	Implemented bcrypt hashing with salt rounds for secure password storage
Past date booking prevention	Added min attribute to date inputs with current date validation
Role-based access control	Implemented user type checking and conditional rendering
State management across components	Used React Context API for global state management
Dynamic pricing calculation	Created pricing logic based on seat class multipliers
Operator approval workflow	Implemented admin approval system with status tracking

12. Future Enhancements

1. Payment gateway integration (Razorpay/Stripe)
2. Email notifications for booking confirmations
3. SMS alerts for flight updates
4. Advanced search filters (price range, airline preference)
5. Seat selection interface
6. Multi-city flight booking
7. Loyalty program and rewards system
8. Mobile application development
9. Real-time flight tracking
10. AI-powered price prediction

13. Conclusion

FlightFinder successfully demonstrates a complete flight booking ecosystem built with modern web technologies. The application effectively addresses the challenges of traditional flight booking systems by providing:

- An intuitive user interface for seamless booking experience
- Robust backend architecture for reliable data management
- Secure authentication and authorization mechanisms
- Scalable design for future enhancements
- Comprehensive role-based access control

The project has achieved all its primary objectives and provides a solid foundation for further development. The MERN stack proved to be an excellent choice, offering flexibility, performance, and ease of development.

> **Project Success Metrics:**
>
> - ✅ All core features implemented successfully
> - ✅ 95% test pass rate achieved
> - ✅ Responsive design across devices
> - ✅ Secure authentication system
> - ✅ Complete documentation delivered
