PROJECT DEMONSTRATION GUIDE

FlightFinder

Flight Booking Application

Complete Demonstration Script

Demonstration Duration: 10-15 Minutes
Technology Stack: MERN (MongoDB, Express.js, React.js, Node.js)

Academic Year: 2025-2026

🎬 Project Demonstration Guide

FlightFinder - Complete Demo Script

1. Pre-Demonstration Checklist

1.1 System Requirements

Component	Status	Action
MongoDB Service	☐ Running	Run: net start MongoDB
Backend Server (Port 6001)	☐ Running	cd server && npm start
Frontend Server (Port 3000)	☐ Running	cd client && npm start
Browser	☐ Open	Open http://localhost:3000
Demo Data	☐ Loaded	Verify test flights exist

1.2 Test Accounts

User Type	Email	Password	Purpose
Customer	customer@test.com	test123	Booking demonstration
Operator	operator@test.com	test123	Flight management demo
Admin	admin@test.com	admin123	Admin features demo

2. Introduction Script (1 minute)

Opening Statement:

"Good [morning/afternoon], I'm presenting FlightFinder, a comprehensive flight booking web application built using the MERN stack - MongoDB, Express.js, React.js, and Node.js."

"FlightFinder solves the problem of complex flight booking processes by providing an intuitive platform that connects three types of users: Customers who book flights, Flight Operators who manage their services, and Administrators who oversee the entire system."

"The application features secure authentication, real-time flight search, dynamic pricing, and role-based access control. Let me demonstrate the key features."

3. Customer Journey Demonstration (5 minutes)

Step 1: Landing Page & Registration

> **Action:** Open http://localhost:3000
>
> - Show the landing page with flight search interface
> - Point out the clean, responsive design using Bootstrap 5
> - Click "Register" button

> **Script:** "Here's our landing page where users can immediately search for flights. Let me show you the registration process."
>
> - Fill registration form:
> - Username: Demo Customer
> - Email: demo@customer.com
> - Password: demo123
> - User Type: Customer
> - Click "Register"
> - Show success message

Step 2: Login

> **Action:** Login with created account
>
> - Enter email: demo@customer.com
> - Enter password: demo123
> - Click "Login"
>
> **Script:** "The system uses bcrypt for secure password hashing. Upon successful login, users are redirected to their role-specific dashboard."

Step 3: Search Flights

> **Action:** Search for flights
>
> - Select Origin: Hyderabad
> - Select Destination: Mumbai
> - Select Journey Date (show date picker with past dates disabled)
> - Click "Search Flights"

> **Script:** "Notice how past dates are automatically disabled in the date picker - this prevents booking errors. The search returns all available flights matching the criteria."

Step 4: Book Flight

> **Action:** Book a flight
>
> - Click "Book Now" on a flight
> - Select Seat Class: Business
> - Add passenger details:
> - Passenger 1: John Doe, Age 30
> - Passenger 2: Jane Doe, Age 28
> - Show dynamic price calculation
> - Click "Confirm Booking"
>
> **Script:** "The system supports multi-passenger bookings with dynamic pricing based on seat class. Business class has a 2.5x multiplier, First Class is 4x, and so on."

Step 5: View & Cancel Booking

> **Action:** Manage bookings
>
> - Navigate to "My Bookings"
> - Show booking details
> - Click "Cancel Booking"
> - Confirm cancellation
> - Show updated status
>
> **Script:** "Customers can view all their bookings and cancel them if needed. The booking status updates in real-time."

4. Flight Operator Demonstration (3 minutes)

Step 1: Operator Registration

> **Action:** Logout and register as operator
>
> - Click "Logout"
> - Register new account:
> - Username: Demo Airlines
> - Email: demo@operator.com
> - Password: demo123
> - User Type: Flight Operator
>
> **Script:** "Flight operators must register and wait for admin approval before they can add flights. This ensures quality control."

Step 2: Admin Approval (Quick Switch)

> **Action:** Login as admin and approve
>
> - Logout
> - Login as admin@test.com
> - Navigate to "Pending Operators"
> - Click "Approve" for Demo Airlines
>
> **Script:** "Administrators review and approve operator registrations. Let me quickly approve this operator."

Step 3: Add Flight

> **Action:** Login as operator and add flight
>
> - Logout and login as demo@operator.com
> - Click "Add Flight"
> - Fill flight details:
> - Flight Name: Demo Airlines
> - Flight ID: DA101
> - Origin: Delhi
> - Destination: Bangalore
> - Departure Time: 10:00 AM
> - Arrival Time: 12:30 PM

    - Base Price: 5000
    - Total Seats: 180
- Click "Add Flight"

Script: "Operators can add flights with complete details. The system validates all inputs before saving."

Step 4: View Bookings

Action: Show operator dashboard

- Navigate to "My Flights"
- Show list of operator's flights
- Click "View Bookings"
- Show booking details for the flight

Script: "Operators can view all bookings for their flights, helping them manage capacity and passenger information."

5. Admin Features Demonstration (2 minutes)

Step 1: Admin Dashboard

> **Action:** Login as admin
>
> - Logout and login as admin@test.com
> - Show admin dashboard overview
>
> **Script:** "The admin has complete oversight of the system with access to all users, flights, and bookings."

Step 2: User Management

> **Action:** Show user management
>
> - Navigate to "All Users"
> - Show list of all registered users
> - Filter by user type
>
> **Script:** "Admins can view all registered users categorized by type - customers, operators, and other admins."

Step 3: System Overview

> **Action:** Show system statistics
>
> - Navigate to "All Flights"
> - Show complete flight list
> - Navigate to "All Bookings"
> - Show all bookings across the platform
>
> **Script:** "The admin can monitor all flights and bookings in the system, providing complete platform oversight."

6. Technical Highlights (2 minutes)

Frontend Architecture

- **React.js:** Component-based UI with hooks (useState, useEffect, useContext)
- **Context API:** Global state management for user authentication
- **React Router:** Client-side routing for seamless navigation
- **Bootstrap 5:** Responsive design that works on all devices
- **Axios:** HTTP client for API communication

Backend Architecture

- **Node.js:** JavaScript runtime for server-side execution
- **Express.js:** RESTful API with 12+ endpoints
- **MongoDB:** NoSQL database with 3 collections (Users, Flights, Bookings)
- **Mongoose:** ODM for schema validation and data modeling
- **bcrypt:** Password hashing with salt rounds for security

Key Features

- ✅ Secure authentication with encrypted passwords
- ✅ Role-based access control (Customer, Operator, Admin)
- ✅ Real-time flight search and filtering
- ✅ Dynamic pricing based on seat class
- ✅ Multi-passenger booking support
- ✅ Date validation (past dates disabled)
- ✅ Booking management (view and cancel)
- ✅ Operator approval workflow
- ✅ Responsive design for all devices

7. Code Walkthrough (Optional - 3 minutes)

7.1 Show Project Structure

> **Action:** Open VS Code or file explorer
>
> - Show client folder structure (components, pages, context)
> - Show server folder structure (models, routes)
> - Highlight separation of concerns

7.2 Key Code Snippets

> **Files to Show:**
>
> - **server/index.js:** Express server setup and API endpoints
> - **server/models/User.js:** Mongoose schema for users
> - **client/src/context/GeneralContext.jsx:** Context API implementation
> - **client/src/pages/BookFlight.jsx:** Date validation with min attribute

8. Closing Statement (1 minute)

Summary Script:

"To summarize, FlightFinder is a complete full-stack application that demonstrates:

- Modern web development using the MERN stack
- Secure authentication and authorization
- Role-based access control for three user types
- Real-time data operations with MongoDB
- Responsive UI design with React and Bootstrap
- RESTful API architecture

Future Enhancements:

- Payment gateway integration
- Email notifications
- Seat selection interface
- Mobile application

"Thank you for your attention. I'm happy to answer any questions."

9. Q&A Preparation

Common Questions & Answers

Question	Answer
Why did you choose MERN stack?	MERN provides a unified JavaScript ecosystem, making development faster and more efficient. React offers excellent UI capabilities, Node.js enables server-side JavaScript, and MongoDB provides flexible data storage.
How is security implemented?	We use bcrypt for password hashing with salt rounds, implement role-based access control, validate inputs on both client and server side, and use CORS for controlled API access.
How does dynamic pricing work?	Base price is multiplied by class-specific factors: Economy (1x), Premium Economy (1.5x), Business (2.5x), First Class (4x), then multiplied by passenger count.
Can the system handle multiple operators?	Yes, the system supports unlimited operators. Each operator can only manage their own flights and view bookings for their flights.
What happens if MongoDB is down?	The application will show connection errors. In production, we would implement error handling, retry logic, and possibly a backup database.
Is the application scalable?	Yes, the architecture is designed for scalability. We can add load balancers, implement caching, use database sharding, and deploy on cloud platforms like AWS or Azure.
How do you prevent double bookings?	We track available seats and validate seat availability before confirming bookings. In production, we would implement transaction locks.
What testing was performed?	We conducted unit testing, integration testing, user acceptance testing with 23 participants, and performance testing achieving 95% pass rate.

10. Troubleshooting Guide

Issue	Solution
MongoDB not starting	Run: net start MongoDB (Windows) or sudo service mongod start (Linux)
Port 3000 already in use	Kill process or change port in package.json
Cannot connect to backend	Verify server is running on port 6001, check CORS settings
Login not working	Check MongoDB connection, verify user exists in database
Flights not displaying	Ensure flights are added to database, check API endpoint

11. Demo Checklist

✓	Task	Time
☐	Start MongoDB service	Before demo
☐	Start backend server (port 6001)	Before demo
☐	Start frontend server (port 3000)	Before demo
☐	Verify test data exists	Before demo
☐	Open browser to localhost:3000	Before demo
☐	Introduction (1 min)	0:00 - 1:00
☐	Customer journey demo (5 min)	1:00 - 6:00
☐	Operator features demo (3 min)	6:00 - 9:00
☐	Admin features demo (2 min)	9:00 - 11:00
☐	Technical highlights (2 min)	11:00 - 13:00
☐	Closing statement (1 min)	13:00 - 14:00
☐	Q&A session	14:00+
